do it →*

Turn the Hetzner deploy runbook into a go/no-go call

The runbook merged today but still waits on four decisions only you can make: the host (CCX33?), the raw-store provider, the missing TRIGGER_SECRET_KEY (RJC-373), and where Coolify gets installed. Codex also flagged five correctness gaps after the merge. I can pull all of it into one prioritized readiness brief.

Top to-dos

☐ Finish and merge PR #51, the verify-skill sync

Your only open PR, ready for review since Aug 31. Codex left two P1s and a P2 unaddressed: add a Playwright recording for the job-detail flow, require

seeded or fixture data for REST verification, and restore the executable bit on control.mjs.

Fix the failing verification dashboard workflow

The scheduled monitoring run hard-failed at 10:13 this morning on the deprecated actions/download-artifact v3. It will keep failing on main every run until it is bumped to v4.

New updates

01

Postgres test-isolation fix merged, with loose ends *Catapulze*

RJC-369 landed on main: per-process throwaway databases, 2,602 stale checkpoint rows cleaned, suite slightly faster. Codex flagged two edge cases that slipped through the merge, orphaned test DBs when setup aborts and a partial-config path that can still write the shared DB.
